REDUCE YOUR RELIANCE ON COMPRESSED AIR

*Do you have Blow-Off, Hold-Down or Cooling Applications blowing Compressed Air to atmosphere?
If so, money is being wasted.*

JetAir can convert your costly compressed air blow-off application to a blower based system and save you money

HOW WE DO THIS

Blow-off(Air Knife), Hold-Down and Cooling Applications require a combination of air pressure and volumetric flow. Compressed air is inefficient for most applications over 4HP because compressors produce more pressure than needed and not enough flow to be effective without wasting energy.

JetAir's JET-2G™ and JET-5™ DirectDrive blowers output the most efficient balance of pressure and flow available. The optimized pressure and flow and variable speed control of our blowers make them the proven and preferred solution for high-speed lines. JetAir's efficiency advantage can significantly reduce or even eliminate compressor capacity giving you better performance for less money.

INNOVATIVE TECHNOLOGY

JetAir is #1 in electrical efficiency because of our high-speed Direct-Drive motor technology, implementation of modern impeller design and smart controls. JetAir's blowers can reduce compressed air electrical consumption by a remarkable 70%. In fact, our systems save so much they can pay for themselves in 4 to 6 months with an average ROI of over 100%. That means thousands of dollars that would have gone into thin air are now bolstering your bottom line.

ENGINEERING PARTNER

JetAir manufactures high-speed blowers, the most comprehensive line of air knives and air components and complete systems for food & beverage, pharmaceutical, industrial and electronic customers worldwide. JetAir Application Engineers are trained to design effective and efficient blow-off solutions for new lines, line performance upgrades and for replacing compressed air blown to atmosphere.

Call to schedule a line audit and learn how we can improve your performance and efficiency today.
